

Normal School Food Ordering App – Main Functions

- Parents can view the **school canteen menu and prices** through the app and order food for their child.
- Food booking should be based **only on the Student ID**.
- When a parent selects the food and proceeds to payment, the app should automatically ask for the **Student ID**.
- Once the Student ID is entered, the system should automatically fetch:
 - Student Name
 - Class
 - Section
 - Parent's Contact Number
- Parents can then select:
 - **Date** on which the food is required
 - **Break/meal period** during which the food will be provided
- **Online payment should be compulsory**. Parents should not be able to place an order without completing the payment.

Vendor Account

The vendor should have a **separate account/dashboard** where they can see:

- Student Name/ID
- Class and Section
- Food item ordered
- Quantity
- Date
- Break/meal period
- Payment status
- Delivery status

Once the food has been delivered, the vendor should be able to mark the order as "**Delivered**" and send a direct notification/message to the parent confirming that the food has been delivered.

Important Requirement

The **main function is that an order cannot be placed without successful online payment**.

I have already created a basic version of this system using **Google Apps Script**, but now I need to develop it as a proper **Android application**.

Additional features can be added later, but these should be the **core/basic functions of the first version**.
